

Postman API Collection: E-commerce Checkout Flow

This project demonstrates how to use **Postman** and **DevTools** to recreate and automate a real-world checkout process on an e-commerce platform. It includes a collection of API requests captured from the browser's Network tab and structured into a complete user journey — from registration to payment confirmation.

Overview

This API flow simulates a typical customer scenario:

1. Register a new user
2. Log in as the user
3. Fetch the user's cart
4. Search for a city
5. Select a product (Bakery category)
6. Add the product to cart
7. Choose delivery from store
8. Select delivery date and time
9. Choose checkout as a private individual
10. Submit the delivery order
11. Select payment by card
12. Pay with VISA
13. Confirm payment (Attempt / Yes)
